

What is claimed is:

1. A method of manufacturing a semiconductor device comprising the step of:
ion-doping an impurity element into a semiconductor film,
wherein said impurity element imparts n-type conductivity or p-type conductivity to
5 said semiconductor film,
wherein a concentration of said impurity element is in the range from 1×10^{15} to 5×10^{17} atoms/cm³ in said semiconductor film after the step, and
wherein a concentration of carbon is at 3×10^{17} atoms/cm³ or less in said
semiconductor film after the step.

10
2. A method of manufacturing a semiconductor device comprising the step of:
ion-doping an impurity element into a semiconductor film,
wherein said impurity element imparts n-type conductivity or p-type conductivity to
said semiconductor film,
15 wherein a concentration of said impurity element is in the range from 1×10^{15} to 5×10^{17} atoms/cm³ in said semiconductor film after the step, and
wherein a concentration of nitrogen is at 1×10^{17} atoms/cm³ or less in said
semiconductor film after the step.

20
3. A method of manufacturing a semiconductor device comprising the step of:
ion-doping an impurity element into a semiconductor film,
wherein said impurity element imparts n-type conductivity or p-type conductivity to
said semiconductor film,
wherein a concentration of said impurity element is in the range from 1×10^{15} to $5 \times$

10¹⁷ atoms/cm³ in said semiconductor film after the step, and

wherein a concentration of oxygen is at 3×10^{17} atoms/cm³ or less in said semiconductor film after the step.

5 4. A method of manufacturing a semiconductor device according to any one of claims 1 to 3, wherein no mass separation is performed in the ion-doping step.

10 5. A method of manufacturing a semiconductor device according to any one of claims 1 to 3, wherein said ion-doping is performed through an insulating film after providing said insulating film on said semiconductor film.

15 6. A method of manufacturing a semiconductor device according to any one of claims 1 to 3, wherein said semiconductor film is used as at least a channel forming region of a TFT.

7. A method of manufacturing a semiconductor device according to any one of claims 1 to 3, wherein said impurity element imparting p-type conductivity comprises a gas containing diborane, BF₂, or boron.

20 8. A method of manufacturing a semiconductor device according to any one of claims 1 to 3, wherein said impurity element imparting n-type conductivity comprises either one of a gas containing P or As, and phosphine.

9. A method for for fabricating a semiconductor device fabricating a semiconductor

device according to any one of claims 1 to 3, wherein the impurity element imparting p-type conductivity is doped into the semiconductor film by employing a source material gas that contains diborane diluted with hydrogen to the concentration in the range from 0.5% to 5%.

5 10. A method of manufacturing a semiconductor device according to any one of claims 1 to 3, wherein the impurity element imparting p-type conductivity is doped into the semiconductor film by employing a source material gas that contains diborane diluted with hydrogen to the concentration in the range from 0.5% to 1%.

10 11. A method of manufacturing a semiconductor device according to any one of claims 1 to 3, wherein the semiconductor device is one selected from the group consisting of a personal computer, a video camera, a portable information terminal, a digital camera, a digital video disk player, an electronic amusement apparatus, and a projector.

15 12. A method according to any one of claims 1 to 3, wherein the concentration of hydrogen to be ion-doped simultaneously with said impurity element in said semiconductor film is set to be at 1×10^{19} atoms/cm³ or less.

20 *sub*
for
com 13. A method of manufacturing a semiconductor device comprising the step of:
ion-doping an impurity element into a semiconductor film,
wherein said impurity element imparts n-type conductivity or p-type conductivity to
said semiconductor film,
wherein a concentration of said impurity element is in the range from 1×10^{15} to 5×10^{17} atoms/cm³ in said semiconductor film after the step, and

wherein a concentration of hydrogen is at 1×10^{19} atoms/cm³ or less in said semiconductor film after the step.

14. A method of manufacturing a semiconductor device comprising the step of:

5 ion-doping an impurity element into a semiconductor film,

wherein said impurity element imparts n-type conductivity or p-type conductivity to

said semiconductor film,

wherein a concentration of said impurity element is in the range from 1×10^{15} to 5×10^{17} atoms/cm³ in said semiconductor film after the step, and

10 wherein said impurity element is doped into said semiconductor film by using a source material gas containing said impurity element diluted with hydrogen to the concentration in the range from 0.5% to 5%.
